The echoes received back into the probe from each of these interfaces are converted by the biometer to spikes arising from baseline. The greater the difference in the two media at each interface, the stronger the echo and the higher the spike. [] If the difference at an interface is not great, the echo is weak and the displayed spike is short (eg, vitreous floaters, posterior vitreous ...

Difference between Parameter and Statistic What is Parameter? A parameter is a value that describes some aspect of a population. A parameter may be very difficult to determine if not impossible, especially in a large population. This is where samples and statistics come into play. However, a parameter can be determined in a very small population where every individual can [...]
