Parallel Circuit. If components are connected in such a way that the voltage drop across each component is same then it is known as parallel circuit.In parallel circuit the voltage drop across each component is same but the currents flowing through each component may differ. The total current is the sum of currents flowing through each element. An example of a parallel circuit is the wiring ...

Answered July 19, 2020. Network is an interconnection of active and passive components such as resistors, capacitors etc and they may or may not have a function. A network can be open or closed loop. On the other hand, a circuit is a network having closed loop for flow of current and has a particular function.

What is the difference between network and circuit? - Quora

A network of impedances with more than two terminals cannot be reduced to a single impedance equivalent circuit. An n-terminal network can, at best, be reduced to n impedances (at worst n C 2).For a three terminal network, the three impedances can be expressed as a three node delta (Δ) network or four node star (Y) network.

An electrical network is an interconnection of electrical components or a model of such an interconnection, consisting of electrical elements. An electrical circuit is a network consisting of a closed loop, giving a return path for the current. Linear electrical networks, a special type consisting only of sources, linear lumped elements, and linear distributed elements, have the property that signals are linearly superimposable. They are thus more easily analyzed, using powerful frequency domain
